

Release Notes for IDC Version 4.0.226

(Emin Can Dogrul; DWR)

This version of IDC was released mainly to streamline it with the latest version of IWFM (v4.0.226). The few modifications that are important to the end-user are as follows:

1. Now the root zone component version number appears as the first line in the Root Zone Main File (please see the Root Zone Main File template). This is a preparation for future improvements where the user will be able to choose from multiple versions of the root zone component with differing conceptualizations. IDC will be able to identify the utilized root zone component by reading the version number from the Root Zone Main File.
2. The IDC documentation now includes an explanation of input and output files.
